EDUCATION

Bachelor's Degree in Software Engineering

Innopolis University

2017 – 2021

Secondary Education (exact sciences)

Academic Lyceum under
Westminster International
University in Tashkent

2014 – 2017

SKILLS

C / C++ (C++23) — Expert
Linux / POSIX — Expert
Networking stack — Advanced
DPDK / SPDK — Advanced
eBPF / NFQ — Advanced
NVMe-oF, io_uring — Advanced
Python — Advanced
Bash / Shell — Advanced

TOOLS

GDB, Valgrind, perf / FlameGraph
tcpdump, Wireshark
Make, CMake
pytest, GoogleTest
systemd, RPM / Spec
Git, Docker

LANGUAGES

Russian — Native
English — Advanced

Summary

Systems programmer focused on networking and storage. 4+ years of production C/C++ experience across router firmware, network virtualization, and block storage software. Comfortable across the stack — from kernel-adjacent fast-paths (DPDK, eBPF, io_uring) to service-level orchestration and tooling. Available for work.

Work Experience

Software Engineer, Wellstor

January 2025 – Present

- Develop block storage software with a focus on NVMe / io_uring device management and inter-node coordination.
- Build the data-path and control-path components in modern C++ on top of Linux primitives.
- Work across SPDK, NVMe-oF and custom userspace pipelines; package and ship via RPM and systemd units.

Junior Software Engineer, Huawei

July 2021 – November 2024

- Maintained and extended a legacy NAT subsystem in C for router firmware, plus internal CLI tooling.
- Built virtual wireless infrastructure for the eNSP Pro simulation platform using NFQ and eBPF.
- Implemented roaming logic for virtual mobile clients across simulated access points.

Projects

living_dnd, github.com/wildluck/living_dnd

2026 — C++23

- Persistent D&D simulator: procedural hex terrain, dynamic weather, kingdoms, trade, and D&D 5e mechanical effects.

cppfolio, github.com/wildluck/cppfolio — wildluck.dev

2026 — C++23, Crow, Python

- Zero-JS portfolio server in C++23 with Crow; HTML templates and personal data baked into the binary at compile time via a Python codegen step.

minibroker, github.com/wildluck/minibroker

2026 — C++

- Lightweight pub/sub message broker: epoll-driven event loop, binary wire protocol, CRC32 integrity checks.

minithreadpool, github.com/wildluck/minithreadpool

2026 — C++23

- Thread pool with priority scheduling, std::future-based result delivery, and graceful shutdown.

ring_buffer, github.com/wildluck/ring_buffer

2026 — C++23

- Header-only lock-free SPSC ring buffer in C++23, with an additional cache-line-optimized variant.

c_chat, github.com/wildluck/c_chat

2026 — C

- Multi-client TCP chat server in C: epoll reactor, thread pool, SHA-256 password authentication.
